                           And through one round of normalization to Rot = 5.0 and subtraction to Rot = 25.0. Second strand cDNA was prepared with the primer adapter of sequence [5, Georgian Strand Tranda Tranda
subsequently enriched for full-length by cap-trapper. CDNA went bugh one round of normalization to Rot = 5.0 and subtraction to = 25.0. Second strand CDNA was prepared with the primer adapter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /tissue_type="tongue"

15 likely internal to the message. cDNA Library Preparation: M.B.

Soares Lab Clone distribution: Researchers may obtain BMAP cDNA

clones from RESEARCH GENETICS. It should be noted that Bento Soares
is generating a small number of additional specialized

non-redundant arrays of BMAP cDNAs whose availability will be
considered under appropriate and limited collaborative arrangements
The following repetitive elements were found in this cDNA sequence:
11-31, >(CAG)n#Simple_repeat

polylinker; Site_1: Not 1; Site_2: Eco RI; The
NIH_BMAP_MSC library is a non-normalized library
constructed from mouse spinal cord. The tag is a string
of 5 nucleotides present between the Not I site and the
oligo-dr track. The library was constructed as described
by Bonaldo, Lennon and Soares, Genome Research 6: 791-806
/lygo-dr Lissue provided by Ms. Annie Novakovich,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligo-dT track not found, Not I site shown in beginning of sequence is likely internal to the message. CDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means that is soon to be determined. When NIH etermines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. The following repetitive elements were found in this cDNA sequence: Seq primer: M13 Forward

Fig. 2014.95 30.00 to 10 in the control of sequence object of track not found, Not I site shown in beginning of sequence is likely internal to the message. CDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BMAP CDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP CDNAs whose availability will be considered under appropriate and limited collaborative arrangements The following repetitive elements were found in this CDNA sequence: 1-31, >(CAG)n#Simple_repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BE995172 455 bp mRNA linear EST 05-OCT-2000 UI-M-CGOp-bil-h-10-0-UI.sl NIH_BMAP_Ret4_S2 Mus musculus CDNA clone UI-M-CGOp-bil-h-10-0-UI 3', mRNA sequence.

                                                                    The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alloviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                 The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-call differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         540

                                                                                                                        The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                999

This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based cDNA library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene a ppears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a critical disulphide bridge important for secondary structure. The collowing are claimed: a 10825 bp genomic DNA sequence (I) (see AAP96690), the 1437 bp cDNA sequence (Ia) and their 24d1, 24d2 and collowing are claimed: a 10825 bp genomic DNA sequence (I) (see AAP96690), the 1437 bp cDNA sequence (Ia) and their 24d1, 24d2 and 24d7, oar appetide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method mutation; an annial model for the HH disease; metal chelation agents, T-cell differentiation factors and therapeutic agents for the mitigation of injury due to oxidative process in vivo or inigiation of injury due to oxidative process in vivo or the harmannest; and the presence or an enthod or contential annity for annity the presence or metation of injury due to oxidative process in vivo or the harmannest or the mitigation of injury due to oxidative process in vivo or the harmannest or the har

```
The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                  1440

This sequence represents the haemochromatosis (HC) gene. Mutations in this sequence are detected using the method of the invention. The method is for identifying an individual with hereditary haemochromatosis (HH) or a predisposition to develop HH or to genetically pass on HH to an offspring, comprising isolating a biological sample and amplifying a coffspring. Comprising isolating a biological sample encompassing all or part of the DNA between markers D6265 and D6276, and detecting at least one homozygous or heterozygous mutation in a nucleotide within the region. The method can also be used for identifying an individual with an autosomal recessive discorder (ARD) or predisposition to develop and/or genetically pass on an ARD to an offspring, comprises isolating a biological sample from the individual and screening genomic DNA in the sample for the presence of a homozygous or heterozygous mutation in a

gene, the normal function of which, is required to prevent progression of the disorder. The method(s) can be used to identify individuals that are homozygous or heterozygous (carriers) for the mutation causing the ARD. Especially the method is used to diagnose HH or predisposition to HH by detecting a Cys282Tyr substitution. Individuals homozygous for this mutation have HH and heterozygotes are potential carriers of the

The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A95769 (Genbank Accession number U60319). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder.

e.g. haemochromatosis, or a genetic susceptibility to develop it.

The invention relates to human polynucleotides (AAI63803-AAI64012) and the encoded proteins (AAM43467) and seful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The cor ameliorating medical conditions e.g. by protein or gene therapy. The genes were isolated from a range of human tissues disclosed in the genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, c. e.g. breast and ovarian cancer and other cancers of the adrenal gland, cond, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, cautoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as mycardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

Colitis: (c) cardiovascular disorders such as viral, bacterial, fungal cond parasitic infections.

Colitis: (c) cardiovascular disparent did not form part of the princed specification, but was obtained in electronic format directly communication and parasitic format directly communication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TGGGCTGTGAAATGCAAGAAGACAACAGTACCGAGGGCTACTGGAAGTACGGGTATGATG 645
